DETAILED ACTION

Remarks

1. In response to communications filed on 22-June-2004, claims 1, 13, 21-23, 29-31, and 33 have been amended per applicant's request. Claims 1-35 are presently pending in the application.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that said subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 1-5, 7-12, 17-18, 21-24, and 29-31 are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Cohen</u> (U.S. Patent No. 6,356,941 B1) in view of <u>Rose</u> (U.S. Patent No. 6,314,500 B1.)

As to claim 1, <u>Cohen</u> teaches in a computer system including at least one client computer coupled by a communications network (see figure 1) to a remote secure storage facility (see "protected central storage facility" in Abstract) located remotely to the client computer (see column 2, lines 56-60), a method of accessing a dedicated data storage unit (see Abstract and see column 2, lines 65-67 for storing data files (see column 4, lines 23-25) in a secure environment (see Abstract, and see column 13, lines 42-51), the method comprising:

Art Unit: 2165

initiating a request for accessing a dedicated data storage unit of the remote secure storage facility (see column 13, lines 36-43), the remote secure storage facility associated with an address on the communications network (see column 11, lines 46-65);

in response to the request (see column 13, lines 42-51), automatically connecting to the remote secure storage facility at the associated address (see column 4, lines 37-45);

transmitting the request to the remote secure storage facility (see column 14, lines 46-65, and see column 15, lines 17-28); and

granting access to the identified dedicated data storage unit (see column 9, lines 32-46.)

<u>Cohen</u> does not teach the data storage unit associated with a user identification code;

the request specifying at least the remote secure storage facility and a user identification code; and

identifying the dedicated data storage unit associated with the specified user identification code.

Rose teaches a data processing system (see Abstract), in which he teaches: the data storage unit associated with a user identification code (see Abstract; see column 5, lines 4-9, and column 8, lines 25-36);

the request specifying at least the remote secure storage facility and a user identification code (see Abstract; see column 3, lines 16-18, and column 5, lines 1-4); and

Art Unit: 2165

identifying the dedicated data storage unit associated with the specified user identification code (see column 3, lines 27-46, and see column 3, lines 53-64, and see column 8, lines 37-59.)

Therefore, it would have been obvious to a person having ordinary skill in the art to have modified <u>Cohen</u> to include: the data storage unit associated with a user identification code; the request specifying at least the remote secure storage facility and a user identification code; and identifying the dedicated data storage unit associated with the specified user identification code.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Cohen</u> by the teachings of <u>Rose</u>, because including the data storage unit associated with a user identification code; the request specifying at least the remote secure storage facility and a user identification code; and identifying the dedicated data storage unit associated with the specified user identification code, would enable the system to store and retrieve data to/from specific dedicated portions of secured data storage devices, based on the user identification and the identification of the data source. This inclusion allows selective routing of data to different memory sources in a shared memory system. This permits, for example, data to be routed to only a portion of the memory sources associated with a given requester, thereby reducing the bandwidth to other memory sources and reducing overall latencies within the system, as taught by <u>Rose</u> (see column 3, lines 10-20.)

Art Unit: 2165

As to claim 2, <u>Cohen</u> as modified teaches wherein the step of granting access includes granting access to the identified dedicated storage unit (see <u>Cohen</u>, column 9, lines 1-22) in accordance with pre-existing instructions associated with the specified user identification code (see <u>Rose</u>, column 3, lines 39-47, and see column 8, line 60 through column 9, line 5.)

As to claim 3, <u>Cohen</u> as modified teaches wherein the request further specifies a processor identification code associated with a client computer, the step of identifying the dedicated data storage unit including identifying the dedicated data storage unit associated with both the specified user identification code and the specified processor identification code (see <u>Rose</u>, column 3, lines 39-47; column 4, lines 45-60, and see column 9, lines 29-31.)

As to claim 4, <u>Cohen</u> as modified teaches the method including the further step of displaying to a user a directory of data files stored in the dedicated data storage unit (see <u>Cohen</u>, column 10, lines 49-59.)

As to claim 5, <u>Cohen</u> as modified teaches the method including the further steps of:

selecting a data file from the displayed directory of data files (see <u>Cohen</u>, column 9, line 66 through column 10, line 19, and see column 10, lines 46-52); and

transmitting the selected data file to a client computer associated with the request (see <u>Cohen</u>, column 5, lines 16-18; column 10, lines 52-59, and see column 12, lines 25-38.)

As to claim 7, <u>Cohen</u> as modified teaches wherein the request further specifies at least one data file stored on the identified dedicated data storage unit (see <u>Cohen</u>, column 3, lines 53-64), the method further comprising the step of transmitting the specified at least one data file to a client computer associated with the request (see <u>Cohen</u>, column 5, lines 16-18; column 10, lines 52-59, and see column 12, lines 25-38.)

As to claims 8 and 9, <u>Cohen</u> as modified teaches each data file stored in the dedicated data storage unit (see <u>Cohen</u>, Abstract) is assigned a reference identification number by the secure storage facility at the time each data file is initially stored in the dedicated data storage unit (see <u>Rose</u>, column 8, lines 56-59, and see column 9, lines 61-65.)

As to claim 10, <u>Cohen</u> as modified teaches the method including the further steps of:

storing one or more data files in the dedicated data storage unit after access has been granted (see <u>Cohen</u>, column 2, lines 53-56, and see column 5, lines 40-57); and

encrypting the data in the one or more data files in accordance with a user assigned security level associated with each data file to be stored (see <u>Cohen</u>, column 12, lines 38-42.)

As to claim 11, <u>Cohen</u> as modified teaches wherein the step of encrypting the data includes the step of encrypting the data at the secure storage facility prior to storing the one or more data files in the dedicated data storage unit (see <u>Cohen</u>, column 12, lines 35-38, and see column 17, lines 62-65.)

As to claim 12, <u>Cohen</u> as modified teaches wherein the step of encrypting the data includes the step of encrypting the data at a client computer associated with the request prior to storing the one or more data files in the dedicated data storage unit (see <u>Cohen</u>, column 15, lines 24-28.)

As to claim 17, <u>Cohen</u> teaches a secure storage facility having an address on a communications network (see column 11, lines 46-65) and adapted for communication with other devices on the communications network (see column 12, lines 24-43.)

For the remaining steps of this claim, applicant is kindly directed to remarks and discussions made in claim 1 above.

As to claim 18, <u>Cohen</u> as modified teaches the facility further comprising encryption and decryption means for encrypting and decrypting data files associated

with a user identification code in accordance with the set of instructions associated with the user identification code (see Cohen, column 12, lines 39-43.)

As to claim 21, <u>Cohen</u> teaches a secure data storage system (see Abstract), comprising:

a communications network address configured to identify the secure data storage system to a remote computing device communicatively coupled to the secure data storage system via the communications network (see column 4, lines 23-45);

a dedicated data storage unit configured to maintain data files generated by the remote computing device (see column 17, lines 1-7); and

a processing component (see column 4, lines 46-60) configured to receive and process a request to access the dedicated data storage unit (see column 5, lines 4-15), the request specifying the communications network address, the identification code, and a data file maintained with the dedicated data storage unit (see column 11, lines 46-65.)

For the teaching of "the dedicated data storage unit identified by an identification code corresponding to the remote computing device", the applicant is directed to the remarks and discussions made in claim 1 above.

As to claims 22 and 30, <u>Cohen</u> as modified teaches wherein the identification code includes a processor identification code corresponding to the remote computing device (see <u>Rose</u>, column 3, lines 39-47.)

Art Unit: 2165

As to claims 23 and 31, <u>Cohen</u> as modified teaches wherein the identification code includes a user identification code and a processor identification code corresponding to the remote computing device (see <u>Rose</u>, column 5, lines 1-9.)

As to claim 24, <u>Cohen</u> as modified teaches wherein the processing component is further configured to grant access to the dedicated data storage unit in accordance with access instructions associated with the identification code (see <u>Rose</u>, column 3, lines 39-47.)

As to claim 29, <u>Cohen</u> teaches a method (see column 1, lines 5-10), comprising: maintaining data files (see column 10, lines 20-25) with a dedicated data storage unit (see column 17, lines 1-7), the dedicated data storage unit having an associated communications network address (see column 11, lines 46-65);

receiving a request to access the dedicated data storage unit the request specifying the communications network address, and a data file maintained with the dedicated data storage unit (see column 13, lines 31-51); and

granting access for the remote computing device to access the dedicated data storage unit in accordance with access instructions (see column 11, lines 24-32.)

for the teaching of "dedicated data storage unit that is identified by an identification code corresponding to a computing device", the applicant is directed to the remarks and discussions made in claim 1 above.

4. Claims 6, 19-20, 25, and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cohen (U.S. Patent No. 6,356,941 B1) in view of Rose (U.S. Patent No. 6,314,500 B1), as applied to claims 1-5, 7-12, 17-18, 21-24, and 29-31 above, and further in view of Mooney et al (U.S. Patent No. 6,351,813 B1.)

As to claims 6 and 19, <u>Cohen</u> as modified teaches wherein each data file is stored in the dedicated data storage unit, each data file being encrypted (see <u>Cohen</u>, column 17, lines 62-65.)

<u>Cohen</u> as modified still does not teach wherein each data file has a predetermined security level assigned thereto, each data file being encrypted in accordance with its assigned security level.

Mooney et al teaches an access control/crypto system (see Abstract), in which he teaches wherein each data file has a predetermined security level assigned thereto (see figure 9, and see column 5, lines 16-41, and column 14, lines 63-66), each data file being encrypted in accordance with its assigned security level (see column 17, lines 22-28.)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Cohen</u> as modified, to include wherein each data file has a predetermined security level assigned thereto, each data file being encrypted in accordance with its assigned security level.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Cohen</u> as modified, by the teaching of <u>Mooney et al</u>, because wherein each data file has a predetermined security level assigned thereto, each data file being encrypted in accordance with its assigned

security level, enhances the data security by supporting multiple levels of security based on various predetermined user criteria. Assigning a security level to each data file provides a measure of the number of hierarchical steps required to be completed before the user can have access to the file, as taught by Mooney et al (see column 5, lines 16-18.)

As to claim 20, <u>Cohen</u> as modified teaches wherein the set of instructions associated with a user identification code (see <u>Rose</u>, column 3, lines 39-47) specifies read-only, write only or read/write access to data files stored in the dedicated data storage unit associated with that user identification code (see <u>Mooney et al</u>, column 15, lines 1-4.)

As to claims 25 and 32, <u>Cohen</u> as modified teaches wherein the processing component is further configured to encrypt the data files in accordance with a security level (see <u>Mooney et al</u>, column 15, lines 1-4) associated with the identification code . (see <u>Rose</u>, column 3, lines 39-47.)

Claims 13-14 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cohen (U.S. Patent No. 6,356,941 B1) in view of Rose (U.S. Patent No. 6,314,500 B1), as applied to claims 1-5, 7-12, 17-18, 21-24, and 29-31 above, and further in view of Weber (U.S. Patent No. 6,067,618.)

As to claim 13, <u>Cohen</u> teaches in a computer system including at least one client computer coupled by a communications network to a secure storage facility located remotely to the client computer, the remote secure storage facility identified by an address on the communications network and including at least one dedicated data storage unit for storing data files associated with a user identification code in a secure environment, encryption /decryption means and processor means, the remote secure storage facility adapted to allow access to the at least one dedicated data storage unit in accordance with a set of pre-existing instructions, apparatus for accessing the at least one dedicated data storage unit such that the remote secure storage facility is transparent to a client computer (for these and remaining steps of this claim, applicant is kindly directed to the remarks and discussions for modifying <u>Cohen</u> with the teachings of <u>Rose</u>, made in claims 1-5, 7, and 10-12 above.)

Cohen as modified does not teach: a logical data storage peripheral coupled to a client computer, the logical data storage peripheral associated with a remote secure storage facility; and

a controller associated with the logical data storage peripheral and storing the address on the communications network of at least one remote secure storage facility.

Weber teaches a user storage separation system (see Abstract), in which he teaches:

a logical data storage peripheral coupled to the client computer, the logical data storage peripheral associated with the remote secure storage facility (see column 9, lines 41-65, and see column 17, line 65 through column 18, line 4); and

a controller associated with the logical data storage peripheral and storing the address on the communications network of the remote secure storage facility (see column 18, lines 5-20.)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified Cohen as modified, to include a logical data storage peripheral coupled to a client computer, the logical data storage peripheral associated with a remote secure storage facility; and a controller associated with the logical data storage peripheral and storing the address on the communications network of at least one remote secure storage facility.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Cohen</u> as modified, by the teaching of <u>Weber</u>, because including a logical data storage peripheral coupled to a client computer, the logical data storage peripheral associated with a remote secure storage facility; and a controller associated with the logical data storage peripheral and storing the address on the communications network of at least one remote secure storage facility, would provide portability and more control to the user, such as enabling the user to load software programs and store portable files, as taught by <u>Weber</u> (see column 18, lines 9-10.)

As to claim 14, <u>Cohen</u> as modified teaches the apparatus further comprising encryption and decryption means for encrypting data files to be stored in a dedicated data storage unit and decrypting data files retrieved from a dedicated data storage unit (see <u>Cohen</u>, column 12, lines 39-43.)

As to claim 16, <u>Cohen</u> as modified teaches the apparatus further comprising memory means for storing at least one directory, each directory containing a listing of data files stored in a dedicated data storage unit (see <u>Cohen</u>, column 10, lines 52-59.)

6. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Cohen (U.S. Patent No. 6,356,941 B1) in view of Rose (U.S. Patent No. 6,314,500 B1), and further in view of Weber (U.S. Patent No. 6,067,618), as applied to claims 13-14 and 16 above, and still further in view of Mooney et al (U.S. Patent No. 6,351,813 B1.)

As to claim 15, <u>Cohen</u> as modified teaches wherein a data file to be stored in the dedicated data storage unit associated with a user identification code (see <u>Rose</u>, column 3, lines 39-47.)

<u>Cohen</u> as modified still does not teach encrypting in accordance with a user assigned security level.

Mooney et al teaches an access control/crypto system (see Abstract), in which he teaches encrypting in accordance with its assigned security level (see column 15, lines 1-4, and see column 17, lines 22-28.)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Cohen</u> as modified, to include encrypting in accordance with its assigned security level.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified <u>Cohen</u> as modified, by the teaching of

Mooney et al, because encrypting in accordance with its assigned security level would provide assigning a security level to each data file provides a measure of the number of hierarchical steps required to be completed before the user can have access to the file, as taught by Mooney et al (see column 5, lines 16-18.)

7. Claims 26-28 and 33-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Allen et al (U.S. Patent No. 5,546,557) in view of Rose (U.S. Patent No. 6,314,500 B1.)

As to claim 26, <u>Allen et al</u> teaches a computing device (see column 9, lines 9-16), comprising:

a logical data storage peripheral (see Abstract and see figure 2, and column 9, lines 34-36) corresponding to a remote secure data storage system that includes a dedicated data storage unit configured to maintain data files generated by the computing device (see Abstract, see figure 12, and see and see column 8, lines 42-45);

a controller configured to receive a request to access the logical data storage peripheral (see column 14, lines 45-50), the request specifying the logical data storage peripheral, and a data file maintained with the dedicated data storage unit (see column 22, lines 21-26); and

the controller further configured to communicatively couple the computing device to the remote secure data storage system and communicate the request to access the

logical data storage peripheral to the remote secure data storage system (see column 27, lines 62-65, and see column 28, lines 59-61, and see column 30, lines 41-67.)

Allen et al does not teach the dedicated data storage unit identified by an identification code corresponding to the computing device.

Rose teaches a data processing system (see Abstract), in which he teaches: the dedicated data storage unit identified by an identification code corresponding to the computing device (see column 3, lines 39-64.)

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified Allen et al to include the dedicated data storage unit identified by an identification code corresponding to the computing device.

It would have been obvious to a person having ordinary skill in the art at the time the invention was made to have modified Allen et al by the teaching of Rose, because including the dedicated data storage unit identified by an identification code corresponding to the computing device, would enable the system to access the appropriate (requested) storage device associated with the user/data for storage and retrieval purposes.

As to claims 27 and 34, <u>Allen et al</u> as modified teaches the device further comprising a processor configured to execute the controller, and wherein the identification code includes a processor identification code corresponding to the computing device (see <u>Rose</u>, column3, lines 39-47.)

As to claims 28 and 35, <u>Allen et al</u> as modified teaches the device further comprising a processor configured to execute the controller (see <u>Allen et al</u>, Abstract, and see column 7, lines 25-42), and wherein the identification code includes a user identification code and a processor identification code corresponding to the computing device (see <u>Rose</u>, column 3, lines 39-47).

As to claim 33, the applicant is directed to the remarks and discussions made in claim 26 above.

Response to Arguments

8. Applicant's arguments filed on 22-June-2004 with respect to the rejected claims in view of the cited references have been fully considered but they are not deemed persuasive:

In response the applicant's arguments that there is no motivation to combine Rose with Cohen, the arguments have been fully considered but are not deemed persuasive, because the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, both cited references teach inventions that are in the same field of endeavor, and the

Art Unit: 2165

combination would cause data to be routed to only a portion of the memory sources associated with a given requester, thereby reducing the bandwidth to other memory sources and reducing overall latencies within the system, as taught by <u>Rose</u> (see column 3, lines 10-20.)

In response to the applicant's arguments that "there is no indication whatsoever in Rose of a remote data storage connected via a network to a computer", the arguments have been fully considered but are not deemed persuasive, because <u>Rose</u> teaches "the operational logic for implementing selective data routing consistent with the invention is typically distributed among the various sources and response combination logic" (see column 9, lines 32-41.) Further, <u>Rose</u> teaches "System 10 generically represents, for example, any of a number of multi-user computer systems such as a network server, a midrange computer, a mainframe computer, etc." (see column 5, lines 10-25.)

In response to the applicant's arguments that "Cohen and/or Rose do not show or disclose a request specifying a remote secure storage facility and a user identification code", the arguments have been fully considered but are not deemed persuasive, because Cohen teaches initiating a request for accessing a dedicated data storage unit (see column 13, lines 36-43), and he teaches "remote" storage facility in "the network vault can be accessed through a network from a remote location, such that the user does not necessarily need to be in the same physical location as the central storage facility in order to place data into, and retrieve data from, the network vault." (see

column 2, lines 56-65.) Rose teaches "the data storage unit associated with a user identification code" (see Abstract; see column 5, lines 4-9, and column 8, lines 25-36.) With respect to Rose not being "analogous", the applicant is directed to the remarks and discussions made above.

Conclusion

9. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

10. Any inquiries concerning this communication or earlier communications from the examiner should be directed to Tony Mahmoudi whose telephone number is (571)272-4078. The examiner can normally be reached on Mondays-Fridays from 08:00 am to 04:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Dov Popovici, can be reached at (571) 272-4083.
